

Service / Technology Fact Sheet

The solar forecast service SteadySat was developed in response to intra-day forecasting needs (up to 6 hours in advance) and is intended primarily for network operators (TSOs and DSOs), but also for electricity producers, traders or suppliers. This production forecast service allows in particular to:

- > Manage the injection gap recorded during the day compared to the previous day's announcement, and reduce associated costs (penalties, risks);
- > Set up and operate a storage system associated with a solar power plant;
- > Efficiently exploit solar resources in an island environment or in non-interconnected areas, while reducing the use of fossil fuel energy;

> Manage the hybridization of a fossil fuel off-grid power plant using solar power to reduce the average cost per MWh locally produced;

> Manage a micro-grid network operating multiple power assets to maximize the use of the solar resource.

Coupled to weather forecast (SteadyMet), satellite imagery allows more accurate evaluation of cloud cover evolution and production profile over the coming hours. This module uses satellite images collected 1-4 times per hour. Through detailed modelling and advanced mathematical algorithms, energy production is predicted over the following hours with increased capability for assessing fluctuation risks and intermittency.

steadySat structure

EXPERT **steadysun**, configuration, optimized solution

SATELLITE IMAGES

(MeteoSat, GOES East, GOES West, MSAT, etc...)

> Data **RECEPTION & TREATMENT**, modelling

STEADYSUN ALGORITHM

SELF-LEARNING

> **SOLAR PRODUCTION FORECAST** from 0 to 6 hours

> **TIME STEP** from one minute

> **UPDATED UP TO 96 TIMES / DAY**

Selection and processing of satellite images

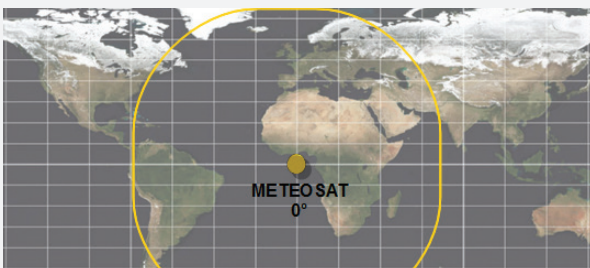

Worldwide coverage

GOES-East & West for US and South America

EUMETSAT for Europe and Africa

Feng Yeng (FY-2) for Asia and Australia

Forecast for a 12 kW small plant with percentiles

Forecast for an island (36MW) with percentiles

Forecast pfor a region (2500mW) with percentiles

Forecast for a country without percentile

Production & forecast history (data over one year)

FEATURE	AVAILABILITY
Forecast at country level	
Forecast at regional level	
Forecast at town level	
Forecast at site level	
Forecast for a portfolio (stations spread over a territory)	
DNI (Direct Normal Irradiance) forecast	
GHI (Global Horizontal Irradiance) forecast	
GTI (Global Tilted Irradiance) forecast	
Temperature forecast	
Production forecast	
Time horizon up to 15 days	
Time horizon up to 6 hours	
Time horizon up to 60 minutes	
Update 4 times / day	
Update 96 times / day	
Update 1440 times / day	
Time step from one minute	
Suitable for all PV technologies	
Applicable à la technologie CPV (Concentrated Photovoltaic)	
Applicable à la technologie CSP (Concentrated Solar Power)	
Including 1-axis tracking	
Including 2-axis tracking	
Percentiles (P10, P20, P30, P40, P50, P60, P70, P80, P90)	

Steadysun offers a range of upgradable solutions to meet your future needs. We invite you to discover our long-term forecasting solution **SteadyMet** and our quasi real-time forecast solution **SteadyEye**.
